Spotify Account and Twitter Feed Web App:

Spotify and Twitter are some of the most popular apps used today. At any given moment, someone can be listening to their favorite music while at the same time becoming more connected all over the world via Twitter. This raises the question, how can these two great services become more closely integrated with each other? We believe we have found the answer to this problem. Logging into Spotify via our web application, we will have the power to pull a user's favorite artists, tracks, and genres from any given account. From there, our application will be able to retrieve the latest and most relevant twitter feeds based on one's music preferences allowing them to become closer with the music world. Listening to someone's music is one thing, but having the ability to see a personalized twitter feed of your favorite artists is a whole new level of connectivity. A more relevant twitter feed will allow you to enjoy your music on a greater level while also not distracting you with non-music related tweets. If your favorite artist releases a new track or announces a new tour schedule, this web application will be the first to tell you. Certainly this can be done with just having a simple twitter account and following the artist, but when you are dealing with hundreds of songs and hundreds of artists it no longer becomes that simple.

Yelp and ParkMe Web App:

Searching for a great place to eat with the variety of options available can be extremely daunting. Take that along with the task of finding parking can make eating out not as enjoyable as it should be. What if there was an app that could do both in an instant? When it comes to providing helpful and reliable reviews for local restaurants, Yelp is a popular solution. Combine that with the power of Parkme, a mobile application that allows the user to search for parking by price and availability in the area, all within a click of a button is no longer an impossible dream. Not only will the user be able to retrieve parking information, directions to that parking space is another feature of Parkme that can be integrated in our web app. The motivation for this app is maximum user oriented experience, all the while proving to be a handy tool for everyday use.
